¹ Commerzbank AG Germany's consumption data, the data collection mode and the calculated CO₂ emissions have been verified since 2009 by the external company DNV Business Assurance Zertifizierung und Umweltgutachter GmbH. Since 2010, the verification process has been based on ISO 14064-3.

² For the year under review from 1 January to 31 December 2020, the current expanded VfU standard (version 1.4 of 2018) was used to calculate carbon emissions. It is based on international environmental and climate reporting standards such as GRI and the GHG Protocol.

³ The decrease in consumption levels is partly due to the restrictions imposed during the Corona pandemic. In particular, the mobility restrictions, the high share of home office activity, and the partial closures of AG Inland branches during the lockdown periods all contributed to this decline.

⁴ The significant reduction in consumption is caused by fewer test runs due to repairs, as well as the transfer of operator responsibility to the building owner at a central back-office location of AG Inland.

⁵ Due to business travel restrictions, business trips were substantially lower than in the previous year. This resulted in a significantly smaller percentage of business trips compared to the previous year for bank vehicles of the AG Inland. Business travel accounted for 41.76 percent of bank vehicle use in 2020. A flat rate of 80% was assumed as business trips by bank vehicles of the AG abroad.

⁶ Commuting is only surveyed for AG Inland due to the available basic data. The calculation was based on the latest data from the Federal Statistical Office and the average number of full-time equivalents in 2020. For the first time, the commuting distances of employees and the proportion of public transport users (with monthly/annual pass) were evaluated objectively. In addition, an average home office ratio was considered for the first time.

⁷ The decrease is since well water at the Munich site does not have to be taken into account, as no water treatment takes place (closed-circuit cooling). There is complete recirculation into the groundwater.
